Cotton Varieties Planted, United States  
1982 crop

Stoneville was the leading variety of upland cotton planted in the United States during the 1982-83 season, according to the Cotton Division, Agricultural Marketing Service, USDA. Stoneville accounted for 21 percent of the national acreage. Deltapine was the second most popular variety planted, accounting for 16 percent of the acreage. Acala, at 14 percent, was the third most popular variety. Tamcot was the next most popular variety at 10 percent of the acreage, followed by Lankart at eight percent and Paymaster at five percent of the U. S. acreage.

Stoneville was the leading variety of upland cotton planted in the United States in 1982. Stoneville accounted for 21 percent of the acreage planted and was up from 16 percent last season. Stoneville was the leading variety planted in Alabama, Arkansas, Mississippi, Missouri and Tennessee and was the second leading variety in Arizona and Louisiana. The most popular Stoneville strain was Stoneville 825 which accounted for 16 percent of the U. S. acreage.

Deltapine was the second most popular variety planted in 1982 and accounted for 16 percent of the U. S. acreage. This was the same percentage as a year earlier. Deltapine was the leading variety planted in Arizona and Louisiana and was the second most popular variety in Alabama, Arkansas, California, Mississippi and Missouri. Deltapine 41 and Deltapine 61 were the two strains most often planted, each accounting for five percent of the U. S. acreage.

The next most popular variety was Acala, accounting for 14 percent of the U. S. acreage and up from 13 percent in 1981. Acala was the leading variety planted in California and New Mexico. Acala SJ-2 was the leading strain planted in California and accounted for 12 percent of the U. S. acreage. The leading strain in New Mexico was Acala 1517-75.

The fourth most popular variety planted in the U. S. was Tamcot which made up 10 percent of the acreage. In 1981, Tamcot accounted for nine percent of the acreage. Tamcot was the leading variety planted in Texas. Tamcot SP-21, at four percent of the U. S. acreage, was the most popular Tamcot strain.

Lankart was the fifth most popular upland variety planted in 1982. Lankart accounted for eight percent of the U. S. acreage and was the most popular variety planted in Oklahoma. Lankart was one of the two second most popular varieties planted in Texas. Lankart 611 was the most popular Lankart strain. Lankart made up 10 percent of the 1981 acreage.

Paymaster was the sixth most popular variety planted. Paymaster accounted for five percent of the U. S. acreage, down from nine percent in 1981. Paymaster was the second most popular variety in New Mexico and was one of the two second most popular varieties in Texas. Paymaster 303 and Paymaster 792 were the most popular strains of Paymaster.

Pima S-5 remained the most popular strain of American Pima cotton planted in the United States. Pima S-5 made up about 91 percent of the 1982 acreage planted, down from 99 percent a year earlier. Pima P-34 was the second most planted strain in 1982. This strain accounted for nine percent of the acreage in 1982 and was up from one percent a year earlier.

Estimates of the percentage of the various varieties of cotton planted in the United States in 1982 by counties, marketing services office areas and states are presented in this report. The variety data are based primarily on estimates furnished by cotton ginners for the territories served by their gins.

- <sup>1/</sup> Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1981", USDA, AMS, Cotton Division, June 1982.
- <sup>2/</sup> Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.
- <sup>3/</sup> Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. Zero gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using stalometer and results are adjusted to the Pressley level.
- <sup>4/</sup> Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
